<sup>1</sup> The Regional Information Report Series was established in 1987 to provide an information access system for all unpublished divisional reports. These reports frequently serve diverse and ad hoc informational purposes or archive basic uninterrupted data. To accommodate timely reporting of recently collected information, reports in this series undergo only limited internal review and may contain preliminary data; this information may be subsequently finalized and published in the formal literature. Consequently, these reports should not be cited without prior approval of the author or the Division of Commercial Fisheries.

## Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used without definition in this report by the Division of Commercial Fisheries. All others, including deviations from definitions listed below, are noted in the text at first mention, as well as in the titles or footnotes of tables, and in figure or figure captions.

<b>Weights and measures (metric)</b>		<b>General</b>	<b>Measures (fisheries)</b>

## **ABSTRACT**

The North River is the largest of the five major tributaries of the Unalakleet River, which is the largest salmon producer in Norton Sound. The counting tower is located approximately 12 kilometers upstream from the village of Unalakleet in Eastern Norton Sound. The North River counting tower is a cooperative project operated by the Native of Village Unalakleet (Unalakleet IRA) with assistance provided by the Alaska Department of Fish & Game (ADF&G). Funding is provided by the Bering Sea Fishermen's Association (BSFA) and the Norton Sound Economic Development Corporation (NSEDC). This report documents the methodology and results of this project for the years 2002 to 2004. The objective of the project is to obtain daily and seasonal information concerning the timing and magnitude of the chum *Oncorhynchus keta*, pink *O. gorbuscha*, Chinook *O. tshawytscha* and coho salmon *O. kisutch* escapement to the North River. In 2002, counting began on 19 June and ended on 29 August. In 2003 and 2004, counting began on 15 June and ended on 13 September in 2003 and 14 September in 2004. The expanded counts for 2002 were: 6,143 chum salmon, 324,595 pink salmon, 1,505 Chinook salmon, and 3,210 coho salmon. The expanded counts for 2003 were: 9,859 chum salmon, 280,212 pink salmon, 1,452 Chinook salmon, and 5,837 coho salmon. The expanded counts for 2004 were: 10,036 chum salmon, 1,162,978 pink salmon, 1,125 Chinook salmon, and 11,187 coho salmon.

Key words: chum salmon, Chinook salmon, pink salmon, coho salmon, counting tower, North River, Unalakleet River, *Oncorhynchus*

## **INTRODUCTION**

The North River is the largest of the five major tributaries of the Unalakleet River, which is the largest salmon producing system in Norton Sound. The North River salmon counting tower is located approximately three kilometers above its confluence with the Unalakleet River on Unalakleet Native Corporation land and has been in operation for nine consecutive years since 1996 (Kohler 2000, 2001, 2002; Rob 1997, 1998, 1999). From 1996 to 2001 Kawerak, Inc. ran the project. The Unalakleet IRA has operated the project since 2002.

A counting tower was previously operated by ADF&G on the North River for the three years from 1972 through 1974 near the North River Bridge (Cunningham 1974, 1975; Regnart and Trasky 1973) and for the three years from 1984 through 1986 (Lean 1985, 1986, 1987). Chum salmon were the primary species harvested by the Unalakleet Subdistrict commercial fishery during the early years of the project. The project was discontinued because of a lack of funding and because the small chum salmon run in the North River was not considered to be a reliable index of chum salmon abundance for the entire Unalakleet River system. However, the subsistence, commercial and sport importance of Chinook, pink, and coho salmon has increased since the project was last discontinued and there are relatively large runs of these species in the North River. These factors, in conjunction with the availability of funding, have once again reactivated this project.

## **OBJECTIVES**

The objective of this project was to obtain daily and seasonal information concerning the timing and magnitude of the chum, pink, Chinook and coho salmon escapement in to the North River.

## **METHODS**

A field camp with two weather port tents and an outhouse was established in mid-June each year. Scaffolding towers were erected on each bank of the river to serve as an observation platform. A 15 x 2.5 meter vinyl canvas flash panel was placed on the river bottom between the two towers.

An array of ten 120-volt lights was strung on a cable between the two towers to illuminate the flash panel during periods of darkness.

The 2004 season was the ninth year the North River tower project operated along this section of river (Figure 1). The tower location was moved down river approximately 100 yards before the 2001 season. The current tower site appears to be in a better location for counting with a smooth bottom and a consistent depth across the river. A diversionary weir was used on this project prior to 2002. At that time, a high percentage of the missed counting time was due to the crew having to spend time maintaining and replacing the weir after it had been washed out by high water. Since 2002, the weir was not installed. Instead a flash panel that spans the entire river was used and a second tower was set up on the bank opposite camp. This tower would only be used if conditions did not allow counting to be conducted from only one side of the River. Since 2002 all counts were conducted from the camp side of the river and use of this second tower has not been necessary.

In 2002, counting began on 19 June and ended on 29 August. In 2003, counting began on 15 June and ended on 13 September. In 2004, counting began on 15 June and ended on 14 September. The project design called for the crew to count 24 half-hour counts throughout the duration of the project. However, in 2003 and 2004 only 16 half-hour counts were scheduled on Saturdays due to budget constraints. The counts from each half-hour shift were doubled to estimate the hourly escapement for each species. The daily counts considered in this report run from 0000 hours to 2330 hours. Each day the reported hourly counts were added to produce a daily subtotal. Every day, the daily and cumulative subtotals for each species were relayed by radio to the Unalakleet ADF&G office.

When hourly counts were missed due to turbid water or other unexpected circumstances the expanded hourly counts for this report were calculated using the following methods. For the hours not counted, the counts were estimated by adding the hourly counts of the day before to the hourly counts of the day following and dividing the result by two, giving expanded hourly counts for the hours of the day not counted. The expanded counts for periods of time greater than one day missed were linearly interpolated in a similar manner (Rob 1997).

## RESULTS

The expanded daily and cumulative totals for each salmon species in 2002 to 2004 are shown in Tables 1 to 3 respectively. The 2002 expanded counts were: 6,143 chum salmon, 324,595 pink salmon, 1,505 Chinook salmon, and 3,210 coho salmon (Table 1). The actual reported 2002 total hourly counts were: 5,930 chum salmon, 316,592 pink salmon, 1,480 Chinook salmon, and 3,038 coho salmon. The 2003 expanded counts were: 9,859 chum salmon, 280,212 pink salmon, 1,452 Chinook salmon, and 5,837 coho salmon (Table 2). The actual reported 2003 total hourly counts were: 8,680 chum salmon, 262,292 pink salmon, 1,222 Chinook salmon, and 3,968 coho salmon. The 2004 expanded counts were: 10,036 chum salmon, 1,162,978 pink salmon, 1,125 Chinook salmon, and 11,187 coho salmon (Table 3). The actual reported 2004 total hourly counts were: 9,634 chum salmon, 1,150,092 pink salmon, 1,104 Chinook salmon, and 9,652 coho salmon.

Tables containing the expanded hourly counts for each species and climatological data from 2002 to 2004 are in Appendix A1–A15.

In 2002, counting began on 19 June and ended on 29 August. On the first day of counting, Chinook and pink salmon were observed. Chum salmon were first observed on 20 June. Coho salmon were first observed on 9 July. The daily peak count of 254 chum salmon occurred on 31 July; the daily peak count of 32,552 pink salmon occurred on 2 July; the daily peak count of 184 Chinook salmon occurred on 3 July; the daily peak count of 306 coho salmon occurred on 18 August (Table 1).

In 2003, counting began on 15 June and ended on 13 September. Chinook salmon were observed on the first day of counting. Chum and pink salmon were first observed on 21 June. Coho salmon were first observed on 18 July. The daily peak count of 798 chum salmon occurred on 25 July; the daily peak count of 28,067 pink salmon occurred on 19 July; the daily peak of 152 Chinook salmon occurred on 1 July; the daily peak count of 437 coho salmon occurred on 28 July (Table 2).

In 2004, counting began on 15 June and ended on 14 September. Pink salmon were observed on the first day of counting. Chum salmon were first observed on 19 June and Chinook salmon on the following day. Coho salmon were first observed on 9 July. The daily peak count of 754 chum salmon occurred on 20 July; the daily peak count of 111,152 pink salmon occurred on 29 June; the daily peak of 154 Chinook salmon occurred on 11 July; the daily peak count of 560 coho salmon occurred on 8 August (Table 3).

## DISCUSSION

In 2002, 2003 and 2004, 4.1%, 16.1% and 8.9% of the hourly counts respectively were calculated compared to the average from 1996 to 2001, when 27.4% of the hourly counts were calculated (Table 4). Removal of the partial weir and low water levels in 2002 to 2004 appear to have helped to reduce the number of hours when counts were not made.

In 2002, counts were missed due to high murky water on 6 July and 10 August to 11 August. The longest time missed counting was for a 16-hour period starting on 10 August. In 2003, counts were missed due to high murky water during the periods from 2 July to 3 July, 26 July to 28 July, 15 August to 16 August, and 24 August to 30 August. In 2004, counts were missed due to high murky water from 13 August to 17 August. From 2002 to 2004, all other multiple hour counts missed were due to crew schedules. Actual hours not counted are shown in the table of expanded hourly counts for each species from 2002 to 2004 in the Appendix A tables 1-12. With few hourly counts missed in 2002 to 2004, interpolations to estimate salmon abundance appear to be good approximations of escapement numbers.

Chum salmon escapement estimates were above the cumulative average from 2002 to 2004 (Figures 2 and 3). In 2002 and 2003 late season chum salmon passage was strong and accounted for the above average cumulative escapement. The early 2003 chum salmon passage was the lowest on record and lagged well behind average cumulative escapement until counts increased in mid-July. The 2004 chum salmon escapement was the largest count on record (Table 4).

Pink salmon escapement estimates were well above average from 2002 to 2004. North River pink salmon escapement has followed an even-odd cycle with high even-year returns and low odd-year returns. The 2002 pink salmon escapement was the largest return since 1996 (Table 4; Figures 4 and 5). A significant number of pink salmon may have been missed in 2002 when the tower started operation on 19 June. The 4,074 pink salmon count for that day was from only

9 hours of counting. The 2003 pink salmon escapement was the largest odd-year escapement on record and was the fifth largest passage in all years. The 2004 pink salmon escapement was the largest on record and over twice the previous high.

Chinook salmon escapement estimates from 2002 to 2004 were below cumulative average (Figures 6 and 7). The 2002 and 2003 estimates were in the low end of the Sustainable Escapement Goal (SEG) range of 1,200 to 2,600, while the 2004 fell below the 1,200 low end. Escapement estimates have been below average and in the low end range or below for the last 5 years. From 2002 to 2004 no commercial fishing for Chinook salmon was allowed. In 2003 and 2004 sport and subsistence fishing were closed to the taking of Chinook salmon for most of July. Even with the fishing restrictions Chinook salmon escapement still was below average. North River Tower Chinook salmon count represents 40% of the Unalakleet drainage Chinook salmon escapement (Wuttig 1999). The Unalakleet drainage Chinook salmon escapement estimate for 2002 to 2004 is 3,763, 3,690 and 2,813 respectively (Table 5).

In 2002 the coho salmon escapement estimate was well below average while the 2003 and 2004 escapement estimates were average (Figures 8 and 9). The 2002 coho run started slow and continued to be slow until counting ended on 29 August. A significant number of coho may have passed after the end of counting in 2002. ADF&G test net and subsistence catches on the Unalakleet River increased dramatically during the first week of September 2002. In 2003 coho salmon escapement started out above average and then slowed to end around the cumulative average. In 2004 coho salmon escapement started early and ended as the second highest count on record (Table 4). In 2003 and 2004 the tower operated until mid September and it is believed that few coho passed uncounted.

<sup>a</sup> Escapement based on 24-hour counts.

<sup>b</sup> Escapement based on 18-hour counts.

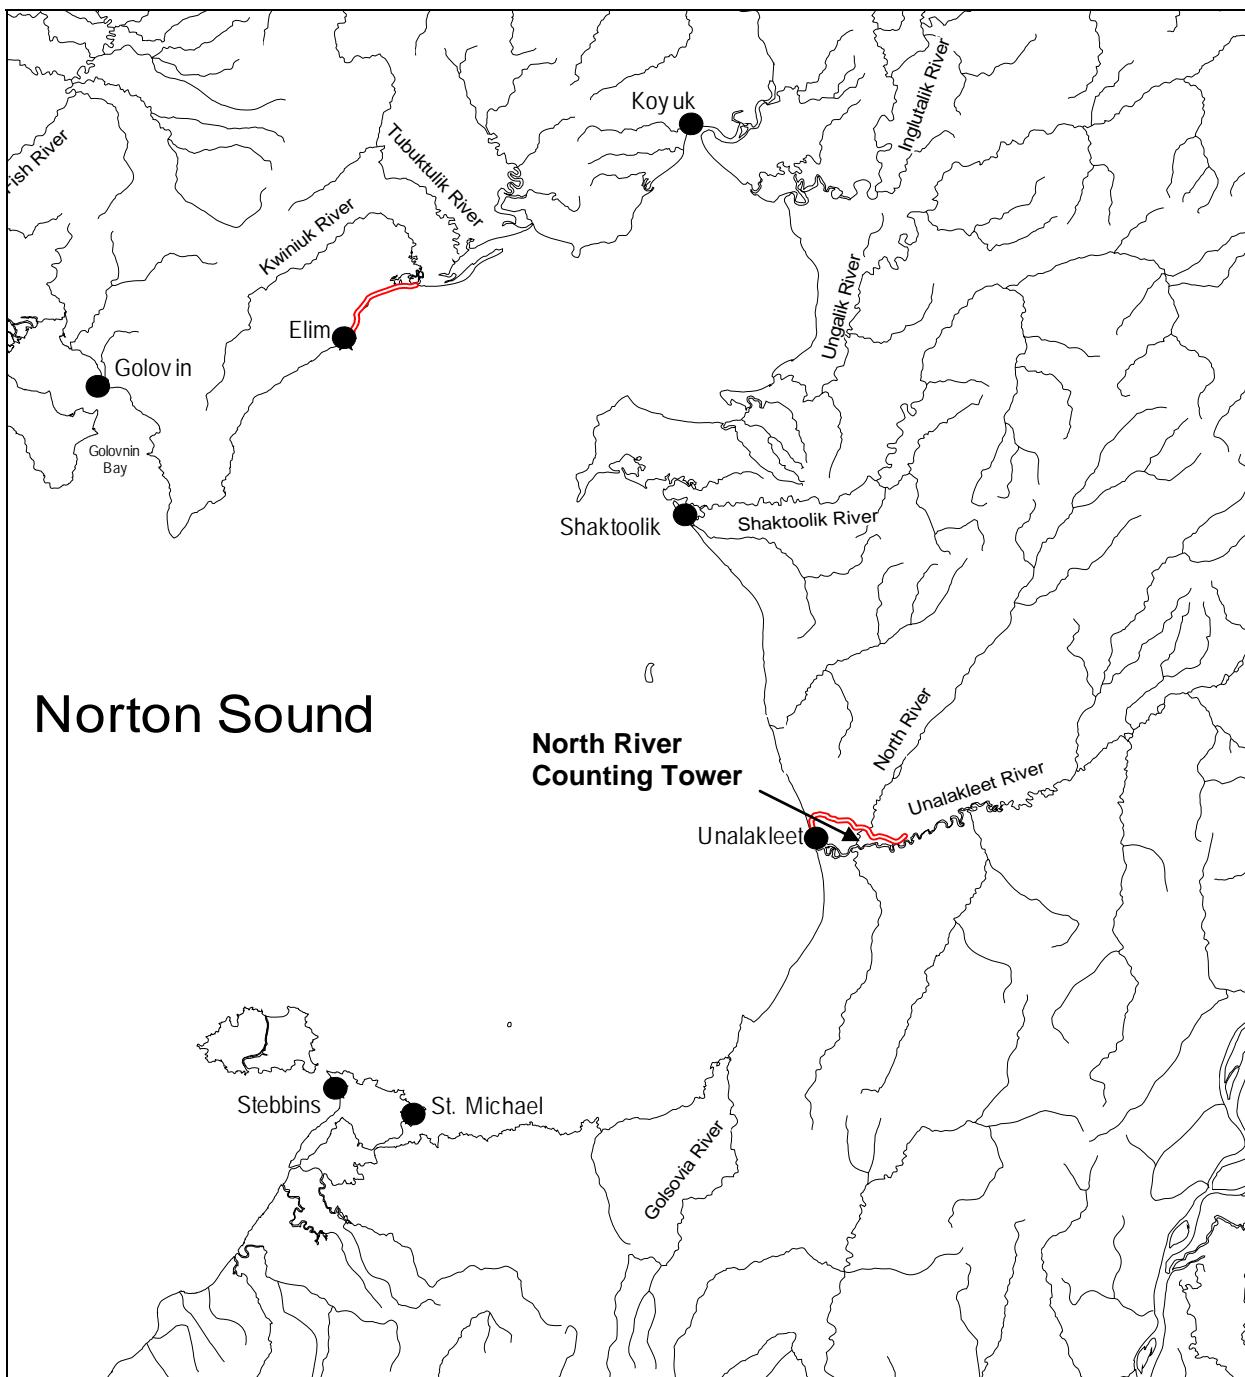

<sup>c</sup> Percent passage estimated unavailable due to lack of detailed data.

<sup>d</sup> Counting project did not monitor escapement during coho salmon run periods, resulting in a lack of coho salmon escapement data.

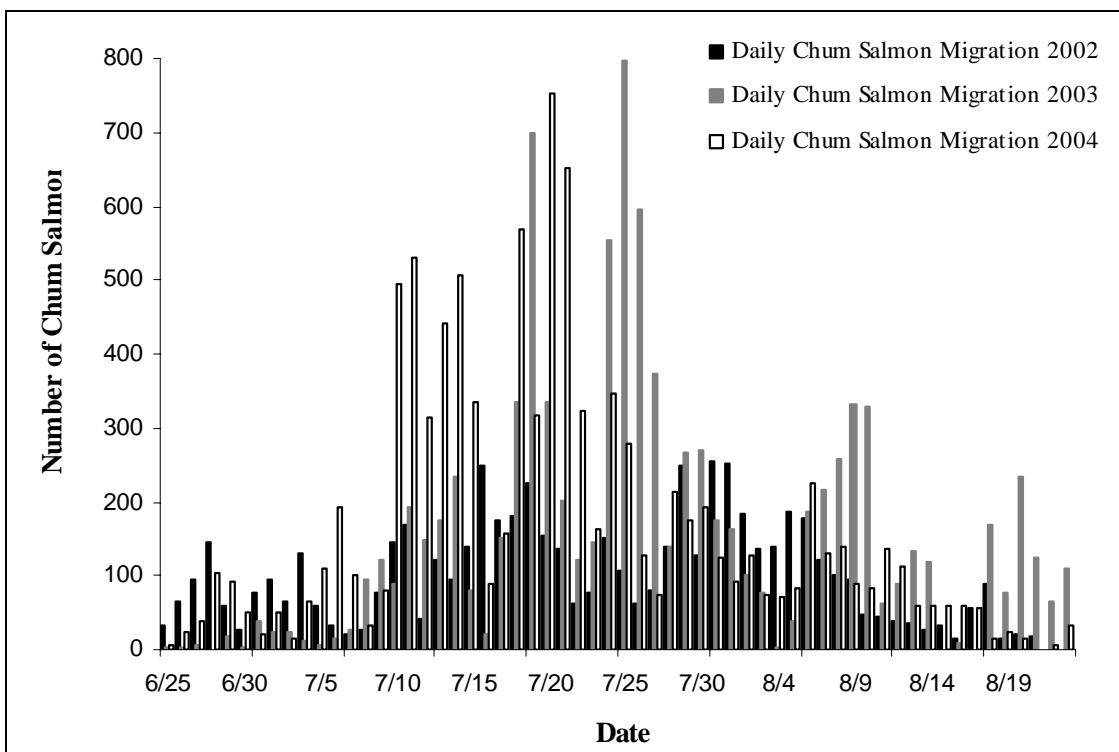

**Table 5.**—North River Tower Chinook salmon count expanded to Unalakleet Drainage Chinook salmon estimate.

Year	Operating Period	North River Tower Chinook Count	Estimated Unalakleet River Drainage Chinook Count
1984	June 25-July 28	2,844	7,110
1985	June 27-Aug 31	1,426	3,565
1986	June 25-July 18	1,613	4,033
1996	June 16-July 25	1,197	2,993
1997	June 16-Aug 21	4,185	10,463
1998	June 15-Aug 12	2,100	5,250
1999	June 30-Aug 31	2,263	5,658
